HOW DOES A SOLAR WATER HEATER WORKS?

The Solar water Heater is based on the principle of black body absorption and Thermosyphon Principle. The black Surface of collector absorbs the heat from the Sun's rays and transfers it to the water passing through the pipes of the collector. Hot Water being lighter, rises to the insulated storage tank and an equal amount of cold water replaces this hot water. This cycle repeats as long as the sun shines, resulting in all the water getting heated for distribution through pipes to the required usage point.
